STATUS: ACTIVE // SYSTEM_NOMINAL
The World's Fastest Cryptographic Timestamp. Period.
Nanosecond Precision. Multi-Chain Immutability. The Fastest Stamp on Earth. BUHS L1 notarizes your data integrity in real-time. Calculate your SHA-256 hash locally, secure it instantly through our high-concurrency Rust pipeline, and lock it forever into the world's most resilient decentralized networks.

"Nano-Time-Stamper"
by @BigTree

📑 INSTRUCTIONS FOR USE : BUHS Nano Time-stamper

Welcome to the BUHS L1 sovereign timestamping client. This tool allows you to prove the existence of a file at a specific point in time by anchoring it in the BUHS Merkle tree in Switzerland, in a completely confidential manner.

🔒 Absolute security and confidentiality
No file is uploaded : The digital fingerprint (SHA-256 hash) is calculated locally within your own browser.
Zero leakage : The content of your documents never leaves your computer. Only the text signature (the hash) is transmitted to the certification server.

🚀 How do I use the web app?

1. Upload your file:
   Method A : Drag and drop your file directly into the dashed box below.
   Method B : Click the center of the frame to open your file explorer and select your file.

2. Automatic anchoring : The application instantly calculates the hash and contacts the server in Switzerland. The steps are displayed in real time in the central console.

3. Anchoring proof : Once the operation is successful, the [BUHS L1 - SECURED] banner appears, allowing you to download your proof receipt (.buhs).

🔍 What should you keep & How to audit?

To prove the prior existence of your document in the future, you must retain:
1. The original file (strictly identical, the slightest modification would change its Hash).
2. The proof receipt (.buhs) provided by the application.

> 📱 SMARTPHONE / MOBILE NOTICE:
  Mobile operating systems (iOS / Android) recognize .buhs proof files as JSON (.json) documents.

This is expected behavior. Store this file safely in your local storage without altering its internal structure.

> 🗓️ NEXT-DAY AUDIT PROCEDURE (DAY+1):
The daily ledger aggregates all daily transactions into a sealed cryptographic Merkle tree (SEALED ROOT).

* Automatic Compilation Schedule:
  The daily log is compiled and published every night. Due to BUHS Bots execution queues, public deployment occurs within a variable window between 05:00 and 06:00 UTC.

* How to verify your transaction:
  Starting the day after your timestamping:
  1. Open the BUHS Audit Mirror interface.
  2. Drop both your original file AND your .buhs proof ticket.
  3. The mirror engine will execute a zero-knowledge local verification:
     - Rebuilding the deterministic V1 hash leaf.
     - Fetching the public ledger corresponding to your transaction date.
     - Verifying the temporal seal integrity: SHA256(PARENT_ROOT + DAY_MERKLE).

👉 Access Client-verify page:

https://xylem.bigtreeconnection.com/verify.html

• Public Advanced Audit BUHS Blockchain (Smart Contracts & Bitcoin OTS):
For institutional, legal, or high-value proof cases requiring native BUHS smart contract anchoring
and Bitcoin blockchain timestamping via OpenTimestamps (OTS):
👉 Access Advanced Audit & Smart Contract Services:

https://xylem.bigtreeconnection.com/verif_protocol/audit_console.html

⚡ NEED REAL-TIME PROOF OR ADVANCED AUDIT?

• Real-Time Live Pipeline (CLI / HTTP Direct):
If your workflow requires instant timestamping validation without waiting for the daily batch compilation,
you can access high-throughput dedicated pipeline streams.
👉 Subscribe to CLI / Direct HTTP Pipeline:

BUHS L1: Sovereign Nanosecond Cryptographic Time-Stamping Infrastructure

BUHS L1 is a high-performance, decentralized Deep Tech protocol built for immutable data notarization. Powered by a deterministic, memory-safe Rust-based handler, the architecture delivers bare-metal execution speeds capable of processing thousands of cryptographic events per second. Time-stamping precision is anchored at the nanosecond scale, micro-synced directly with Swiss Stratum 1 time servers tied to atomic frequency standards for absolute chronological authority.

Operating on a zero-leak, client-side hashing paradigm, payload privacy is absolute. On a daily cycle, all cryptographic signatures are batched and compiled into a cryptographic Merkle Tree. The resulting state root is natively settled and anchored into both the Bitcoin and Ethereum mainnets, leveraging multi-chain consensus to guarantee mathematically unalterable, globally verifiable proof of existence.
